## surgical treatment of Gynecologic pulmonary metasrasis in 1996-2003

### Abstract :

**Objective :** Today , there is a trend to operate pulmonary metastatic involvements . This is our topic of discussion and research .

**Materials and Methods :**

During 1996-2003 , we operated 5 cases of pulmonary metastasis originating from gynecologic neoplaseus . There were 3 cases of cervical cancers , one hydatiform mole , and one case of adenex cancer . The youngest patient was 48 years old , and the oldest was 75 , with an average of 58 years .

**Results :** Our operation procedures included two lobectomy , one total penumonectomy , one wedge resection , and one chest tube and plural drainage . We could not follow the patients for long , but disease-free intervals were between 2 and 12 years . Regarding medical magazines , these cases are rare , and surgical treatment of pulmonary metastasis is new , a challenge for both gynecologic and thoracic surgeons.

**Key words :** Pulmonary / Metastasis , Secondary tumor of the lung , Cervical cancer , Uterus cancer .
