بیولوژی، تشخیص و درمان لوسمی مزمن لنفوسیت B

پرویز کوخانی* (Ph.D)

چکیده

در دو دهه گذشته پیشرفت قابل ملاحظه‌ای در زمینه شناسایی پاتوفیزیولوژی بیماری Chronic Lymphocytic Leukemia (CLL) به دست آمد. پیشرفت ابزارهای تشخیصی موجب شناسایی بیماری در تعداد زیادی از بیماران بدون علامت شد. با بررسی‌های دقیق‌تر CLL بر مبنای تمایل به پیشرفت سریع و یا عدم پیشرفت سریع بیماری به دو گروه با پیش آگهی خوب و بد تقسیم شد. CLL قبلاً به عنوان بیماری غیر قابل درمان افراد مسن در نظر گرفته می‌شد. از آنجائی که اکثر بیماران با بیماری CLL و نه به واسطه آن می‌میرند، درمان‌ها بر علامت درمانی توسط داروهایمانند کلرآمبوسیل متمرکز بوده است. این داروها درمان قطعی بیماری نمی‌باشند، حتی در صورتی که زودتر از موعد مناسب به بیماران داده شود دوره زندگی بیمار را کوتاه‌تر نیز می‌کند. در این مقاله سعی شده است ضمن بررسی اپیدمیولوژی و تشخیص بیماری، عوامل موثر در پیش آگهی CLL تشریح شود. همچنین در باره درمان‌های مختلف از قبیل شیمی درمانی و منوکلونال آنتی‌بادی به اختصار بحث شده است.
